

2030-a brighter, smarter and cleaner future

By Aanya jain 10 G AISG-46

In 2030, I envision a world where people's needs and technology coexist. In my ideal future, people will reside in green, clean cities powered by wind turbines and solar panels. Nature and machines coexist in harmony, and everyone has an equal opportunity to develop and succeed.

By 2030, I believe technology will transform people's lives. AI will assist with daily tasks, schooling, and health care, particularly for children with disabilities, and smart homes will use energy efficiently. It will become commonplace to fly clean-fuel taxis and have robots assist people at work and at home. People will be able to communicate in multiple languages immediately thanks to translation apps.

Sustainability will be the main focus of progress. Renewable energy will take the over fossil fuels. To fight poverty, inequality, and climate change, nations will work together. Respect for equality and human rights will create more inclusive societies.

Kindness, respect, and environmental awareness will be the most crucial traits in this future. I want to help create such a world by learning, sharing, and doing good things. If we have high hopes and work together, the future can be a truly extraordinary time.

Thank you
