

# **My Vision of 2030**

*By: Prisha Verma XII-G*

I don't envision flying cars or robot teachers by 2030; rather, I expect a world with balance. A world where people, progress, and purpose coexist. Solar panels set up on every rooftop, vertical gardens on walls, and public spaces made for humanity and nature. Cleaner air in cities because we finally learned how to give back more than we take. I hope that there will be more peace and understanding in the world by 2030. Cultural, religious, and personal differences will be honoured, and disagreements will be resolved amicably rather than violently. With the advancement of technology comes smarter AI, but humans will have grown wiser. Using AI to achieve maximum productivity aiding both nature and they. As anxiety levels skyrocket, mental health, in the upcoming times will be prioritized as equally as physical health. The world we live in tomorrow is a reflection of the decisions we make today. I don't merely wish for a better world by 2030; I want to contribute to its creation, in which humanity leads with passion and progress is driven by purpose. I imagine giving to this world as a writer, creator, or change-maker. After all, the future won't be perfect, but if we move forward with compassion, intention, and unity, 2030 could be the beginning of something beautiful.
